

🤖 LLM suggestion

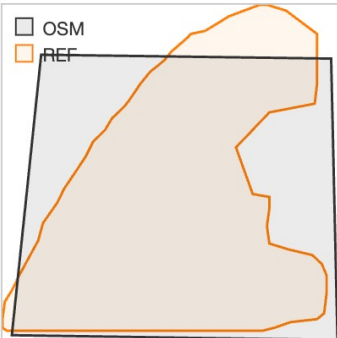

Here is a concise, clear, actionable English summary for the building:

The building's outline deviates significantly from the reference, with an Hausdorff distance of 85.81m (~1% worst case). The center offset is 8.03m (71st percentile), indicating a moderate placement error. Height-wise, OSM data overestimates the actual height by 84.00m (~1%), while area-wise, the footprint is larger than expected by 33.57% (top 25%). To rectify these issues, I recommend inspecting polygon generalization or boundary snapping techniques to correct shape discrepancies, verifying the height source and vertical datum for accuracy, and revisiting footprint scaling or segmentation methods to reconcile the observed deviations.

Concrete suggestions:

Step 7: Read Summary + Concrete suggestions → Plan for Building Data Fix

1. Investigate polygon simplification or boundary snapping algorithms to refine the building's outline.
2. Verify the reliability of height data sources and vertical datums to ensure accurate measurements.

ID: 12364

Center: 116.450324, 39.905666

IoU (OSM vs REF): 46.88%

Summary: Outline/shape discrepancy dominates rather than placement. Center offset: 8.03 m (71%tile). Hausdorff (2D outline): 85.81 m (worst ~1%). Height error: 84.00 m (worst ~1%), OSM taller than reference. Area error: 33.6% (top 25%), footprint area larger than reference. Estimated XY translation for alignment: ~8.03 m towards NW (dx=-6.81 m, dy=4.26 m). Suggestion: inspect polygon generalization or boundary snapping; verify height source and vertical datum; revisit footprint scaling or segmentation.

Values:

- Hausdorff: 85.81m
- Center offset: 8.03m
- Height error: 84.00m
- Area error: 33.57%
